

ENDPOINT SECURITY

From Prevention to Remediation

Comprehensive Endpoint Security

As endpoints proliferate, and the bring-your-own-device (BYOD) mentality becomes more pervasive, organizations face rapidly increasing security risks. Older endpoint protection platforms (EPPs) use static blocking to keep out known threats. But as attackers have become more sophisticated, and as more unknown threats emerge, static blocking has become less effective. Newer EPP solutions, often labeled “next-generation endpoint security”, need to be able to combat these threats with advanced endpoint detection and response (EDR) capabilities.

It's time to prepare your EPP for new threats and risks.

An attack may achieve its goal in the **time it takes a human to evaluate and respond** to it.

The **quantity of undifferentiated alerts** from static defenses can overwhelm security teams.

Attackers rapidly test and refine their attacks to evade defenses against known threats.

Endpoints can be a part of difficult-to-identify, **multi-vector, blended attacks**.

Diverse and **evolving security architectures** require flexible endpoint solutions.

Users' **preferred environments** must be protected.
